Education

University of California, Riverside — Riverside, CA
B.S. in Computer Science with Business Applications — *Expected June 2028*

- **Awards**: UC Berkeley AI Hackathon 2026 Winner, DeveloperWeek 2026 Winner, RoseHack 2026 Winner
- **Relevant Coursework**: Data Structures and Algorithms, Software Engineering and Testing

Experience

Software Engineer Intern — Jun 2026 – Sep 2026
TTickle: Engineers for Good Program — *Riverside, CA*

- Moved an organizing nonprofit off paper onto a shared CRM where ∼20 staff logged **330+ assessments, meeting logs, and notes** in its first month; led requirements, schema, and wireframes as 1 of 4 engineers.
- Shipped the Firebase data model behind onboarding, ladder progression, and assessments, with role-based access so staff see only their own members' data, now the **production system of record** on Azure for **150 members**.
- Consolidated each member's full history and assessment status into a single profile view, replacing records scattered across paper sheets and a whiteboard that staff often couldn't access outside the office.

Software Engineer Intern (Embedded Systems) — Feb 2026 – Jun 2026
Luxcedia, Inc — *Riverside, CA*

- Sustained a measured 49.9 Hz accelerometer stream with 98.8% frame delivery across 13 minutes of in-motion capture, relaying 14-byte frames over TCP between two Raspberry Pi Picos for a gesture-controlled wand.
- Fixed silently corrupted sample timing by timestamping on the sensor and deriving true rate from it, exposing a stall misreported as **24.3 Hz that was actually 47.6 Hz**, and polled the data-ready flag to kill stale reads.
- Stopped sensor resets from hanging the base station with a 3-second silence timeout and reconnect handling.

Founder & Developer — July 2025 – Present
Xpert AI: AI-powered business-launch platform for first-time founders — *Riverside, CA*

- Halved how long users wait to see a response, from **3.8s to 1.9s** (median across 28 requests), by streaming AI chat replies over SSE as they generate instead of waiting for the full answer.
- Restricted the AI assistant to plan steps a user has already reached, enforcing access in the data layer instead of the prompt so the model can't retrieve later steps even when it asks.
- Pinpointed where slow responses come from by timing each request at six stages, separating the AI model's response time from backend overhead.

Projects

ClineShield, AI Safety Layer for Agentic Coding | DeveloperWeek 2026 Winner — Feb 2026

- Blocked destructive AI agent edits before they apply, rejecting patches that exceed team-configurable limits on deleted functions and rewrite size, then returning the reason so the agent retries with smaller edits.
- Logged every blocked edit to an append-only event store, decoupling hook processes from the VS Code extension so a live sidebar updates in under 100ms.
- Eliminated a race condition between parallel hook processes writing a shared metrics file with an atomic write queue in TypeScript, verified across **100 concurrent writers with zero data loss.**

Triage, AI Agent for Automated Bug Reproduction | UC Berkeley AI Hackathon 2026 Winner — Jun 2026

- Automated bug reproduction with a 3-agent system that converts a GitHub issue into browser steps, triggers the bug in a live cloud browser, and confirms it from console errors and a blank render.
- Recovered from failed reproductions with a self-correcting retry loop that feeds console output and screenshots to a diagnosing agent, which reruns the steps or has them rewritten from the original issue.

Technical Skills

Languages: C++, Python, TypeScript, JavaScript, SQL, MicroPython
AI Engineering: Gemini & Claude APIs, tool/function calling, multi-agent systems, LLM evaluation, prompt engineering
Frameworks/Infra: React, Next.js, Node.js, Express, Flask, PostgreSQL, Supabase, Firebase, Azure
Practices/Tools: TDD, Google Test, Valgrind, CMake, Git
